3.

It so happens that this function can be simplified as:

$$c(f) = \frac{-15+14f+8f^2}{5+2f}$$

$$= \frac{(2f+5)(4f-3)}{2f+5}$$

$$= 4f - 3$$

To find the vertical asymptote :

There is no vertical asymptote

To find the horizontal asymptote :

First we must compare the degrees of the polynomials.

The numerator contains a 2^{nd} degree polynomial while the denominator contains a 1^{st} degree polynomial.

Since the polynomial in the numerator is a higher degree than the denominator, there is no horizontal asymptote.

To find the oblique asymptote :

we must divide the numerator by the denominator and so the oblique asymptote $m = 4f - 3$
