

### Example 3. Vertex equal to vertical intercept

Plot  $e(m) = -m^2 - 160$

#### Step 1.

Compute vertex and plot single point:

vertex =  $(0, -160)$

#### Step 2.

Compute e-intercept and plot single point:

e-intercept =  $(0, -160)$

#### Step 3.

There are no m-intercepts!

Instead compute an arbitrary point on any side of vertex:

Random point =  $(-2, -164)$

#### Step 4.

Reflect the point against the vertex's vertical axes:

Reflection =  $(2, -164)$

#### Step 5.

connect the above computed points:

#### Step 6.

Extend the parabola beyond the range of intercepts
