

Example 3. Vertex equal to vertical intercept

Plot $t(z) = -z^2 - 80$

Step 1.

Compute vertex and plot single point:

vertex = $(0, -80)$

Step 2.

Compute t-intercept and plot single point:

t-intercept = $(0, -80)$

Step 3.

There are no z-intercepts!

Instead compute an arbitrary point on any side of vertex:

Random point = $(-3, -89)$

Step 4.

Reflect the point against the vertex's vertical axes:

Reflection = $(3, -89)$

Step 5.

connect the above computed points:

Step 6.

Extend the parabola beyond the range of intercepts
