

Example 3. Vertex equal to vertical intercept

Plot $h(d) = d^2 + 40$

Step 1.

Compute vertex and plot single point:

vertex = $(0, 40)$

Step 2.

Compute h-intercept and plot single point:

h-intercept = $(0, 40)$

Step 3.

There are no d-intercepts!

Instead compute an arbitrary point on any side of vertex:

Random point = $(-2, 44)$

Step 4.

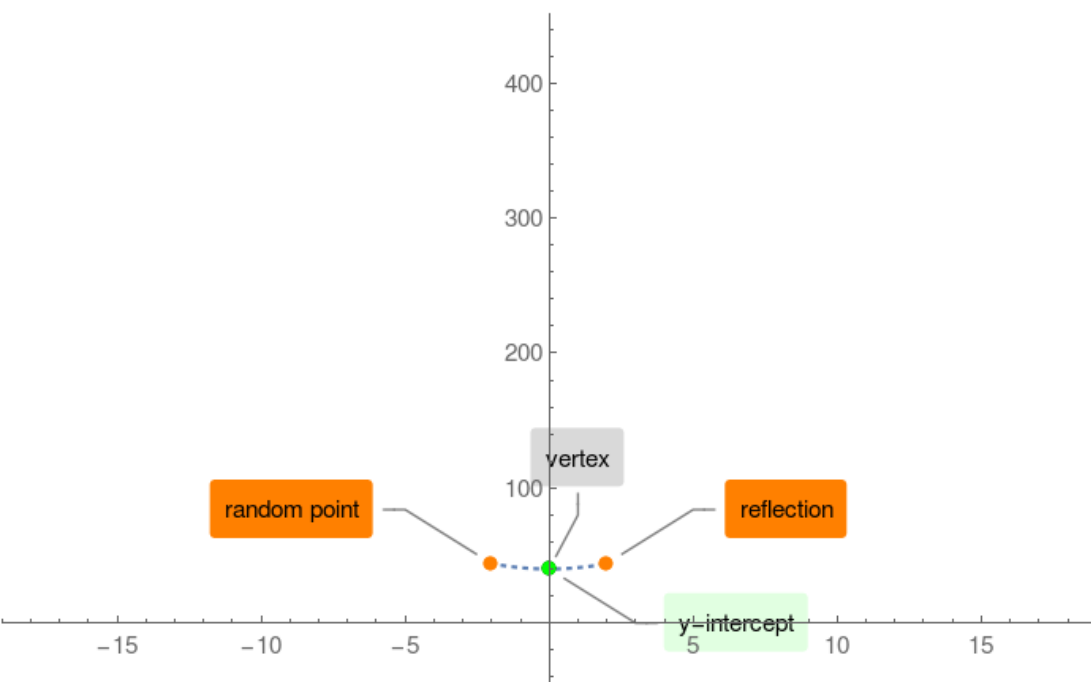

Reflect the point against the vertex's vertical axes:

Reflection = $(2, 44)$

Step 5.

connect the above computed points:

Step 6.

Extend the parabola beyond the range of intercepts
