

1.

1. Perimeter of rectangle = $2(w+a)=273$ where a is the length of the other edge of rectangle. Area of the rectangle is $= w \times a$.

Use perimeter equation

and solve for $a = \frac{273-2w}{2}$

Then reformulate the area $W = w \times a = \frac{273w}{2} - w^2$ which turns out to be a quadratic Parabola:

Compute the vertex $\frac{273}{4}$ and then plug the vertex into the area which will compute the maximum area.
