

Example 3. Vertex equal to vertical intercept

Plot $m(v) = -v^2 - 160$

Step 1.

Compute vertex and plot single point:

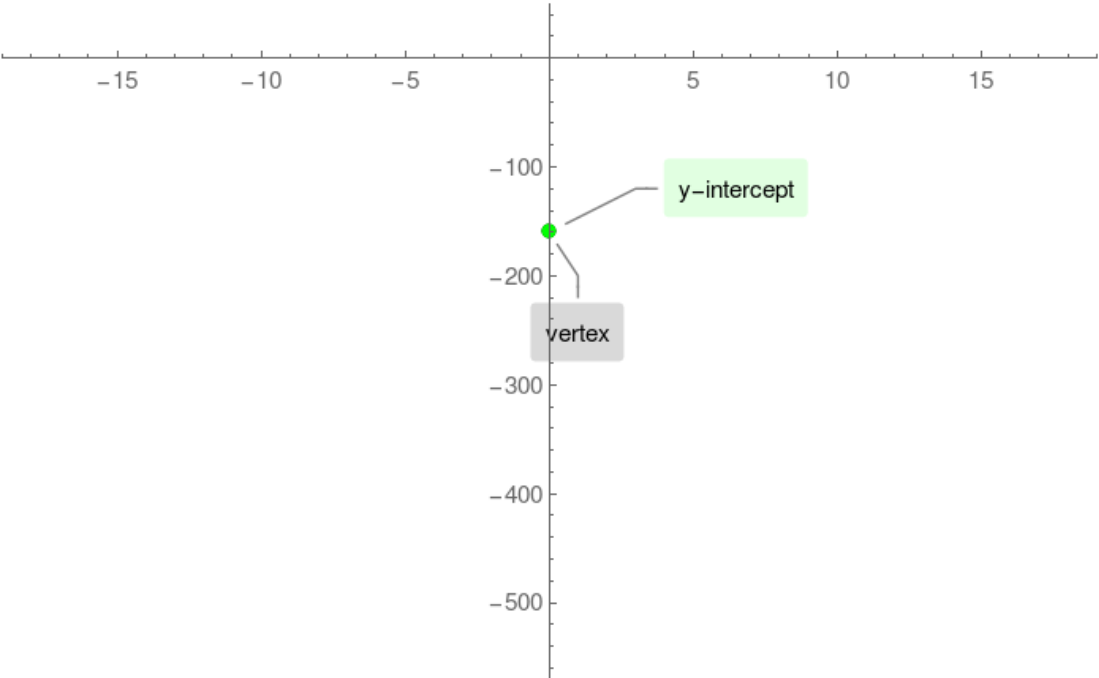

vertex = $(0, -160)$

Step 2.

Compute m-intercept and plot single point:

m-intercept = $(0, -160)$

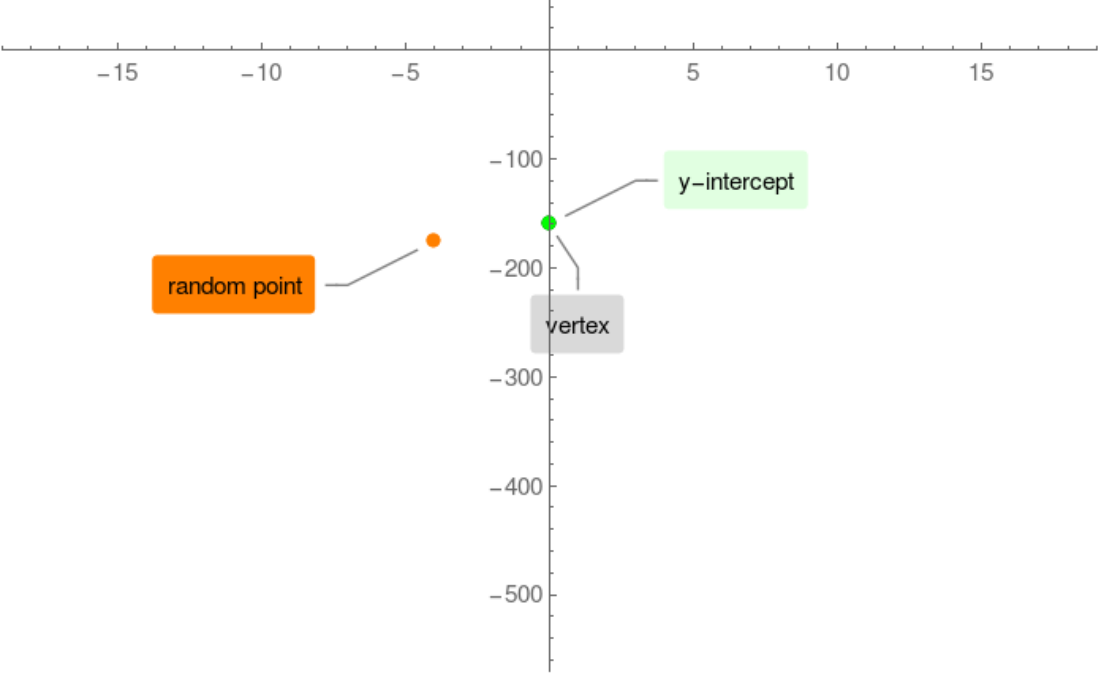

Step 3.

There are no v-intercepts!

Instead compute an arbitrary point on any side of vertex:

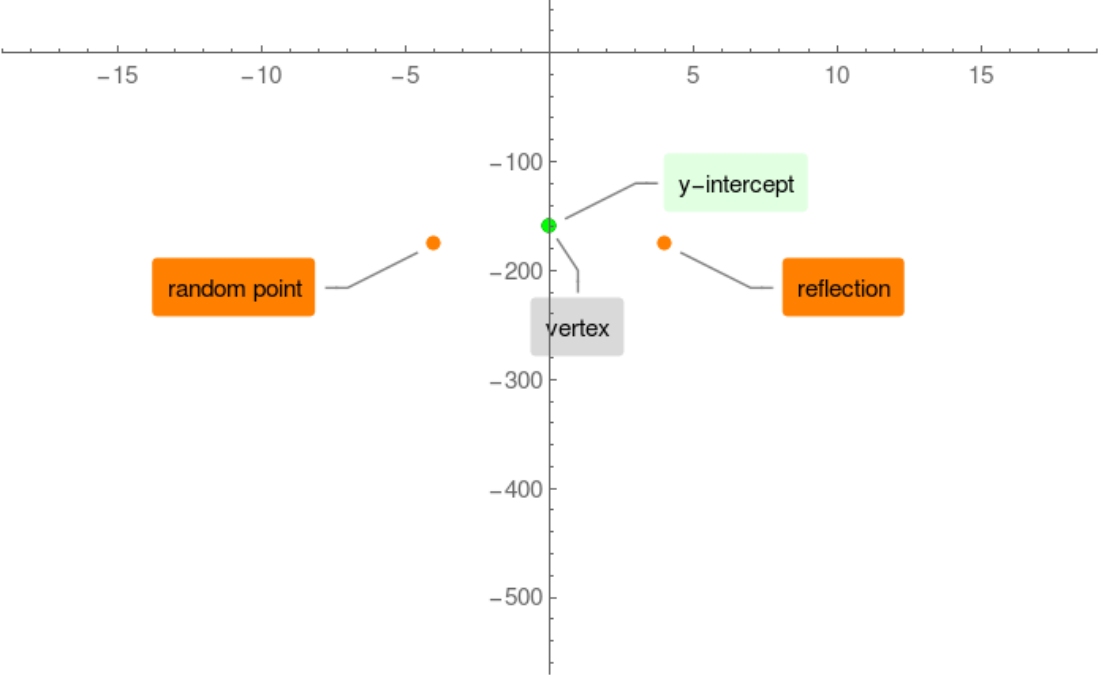

Random point = $(-4, -176)$

Step 4.

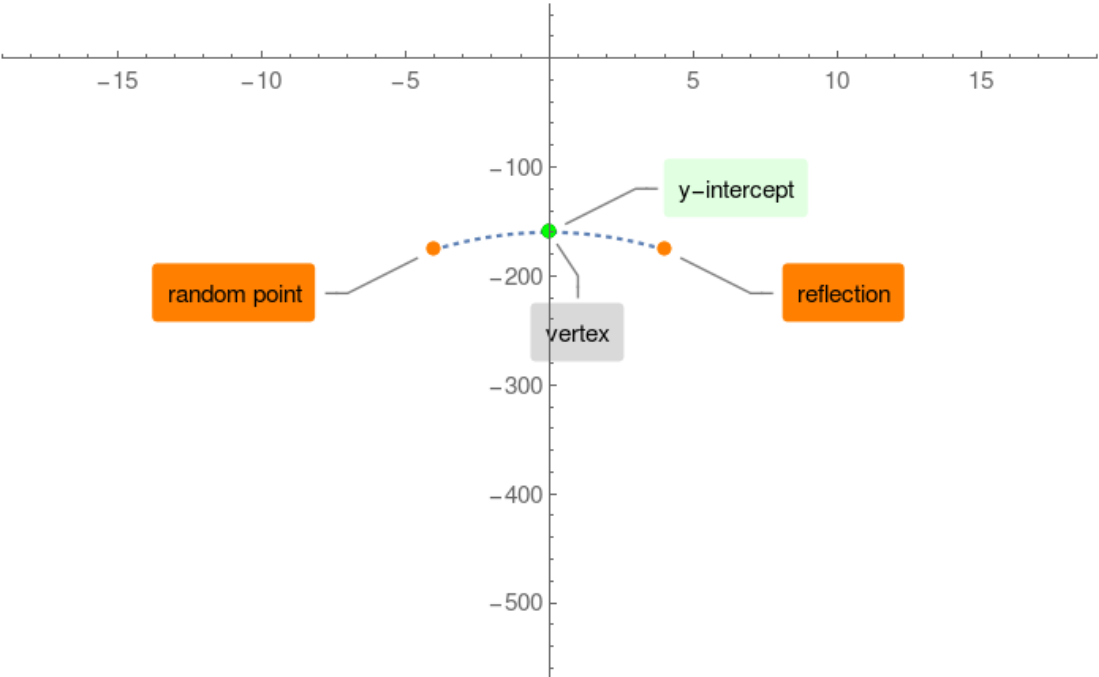

Reflect the point against the vertex's vertical axes:

Reflection = $(4, -176)$

Step 5.

connect the above computed points:

Step 6.

Extend the parabola beyond the range of intercepts
