

Example 3. Vertex equal to vertical intercept

Plot $d(z) = -z^2 - 40$

Step 1.

Compute vertex and plot single point:

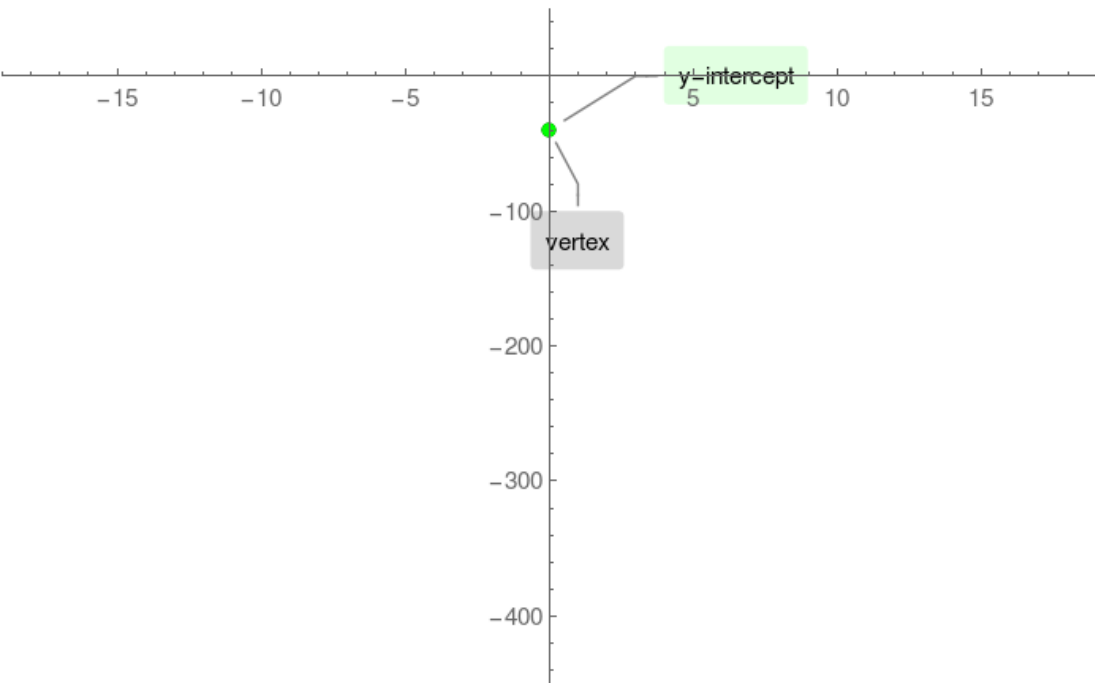

vertex = $(0, -40)$

Step 2.

Compute d-intercept and plot single point:

d-intercept = $(0, -40)$

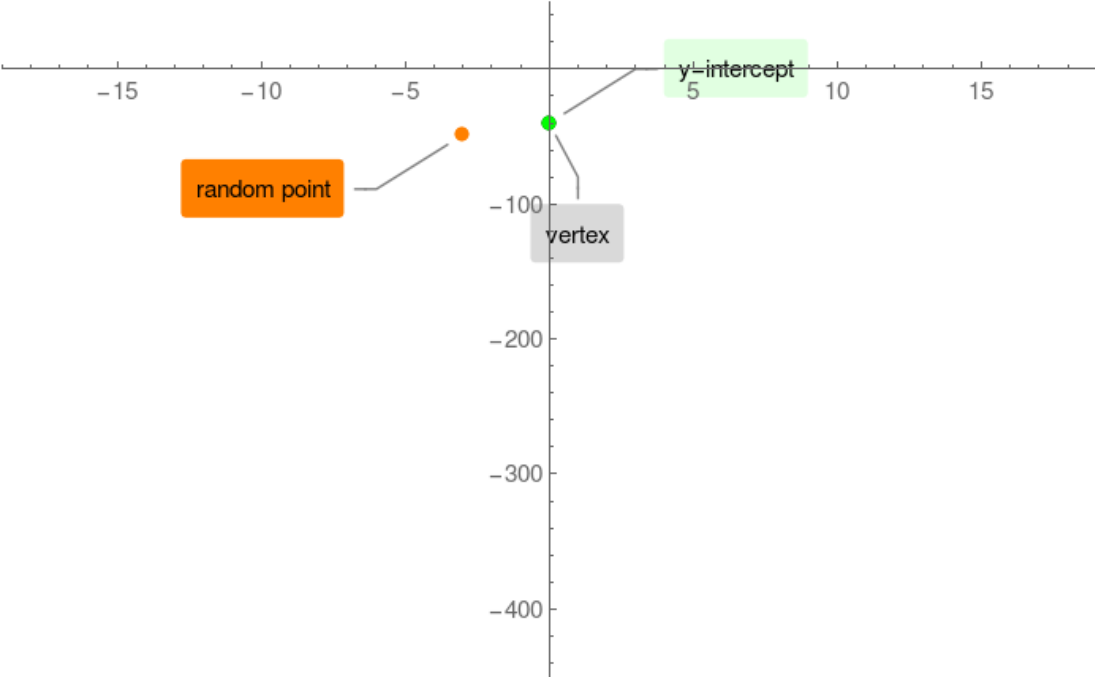

Step 3.

There are no z-intercepts!

Instead compute an arbitrary point on any side of vertex:

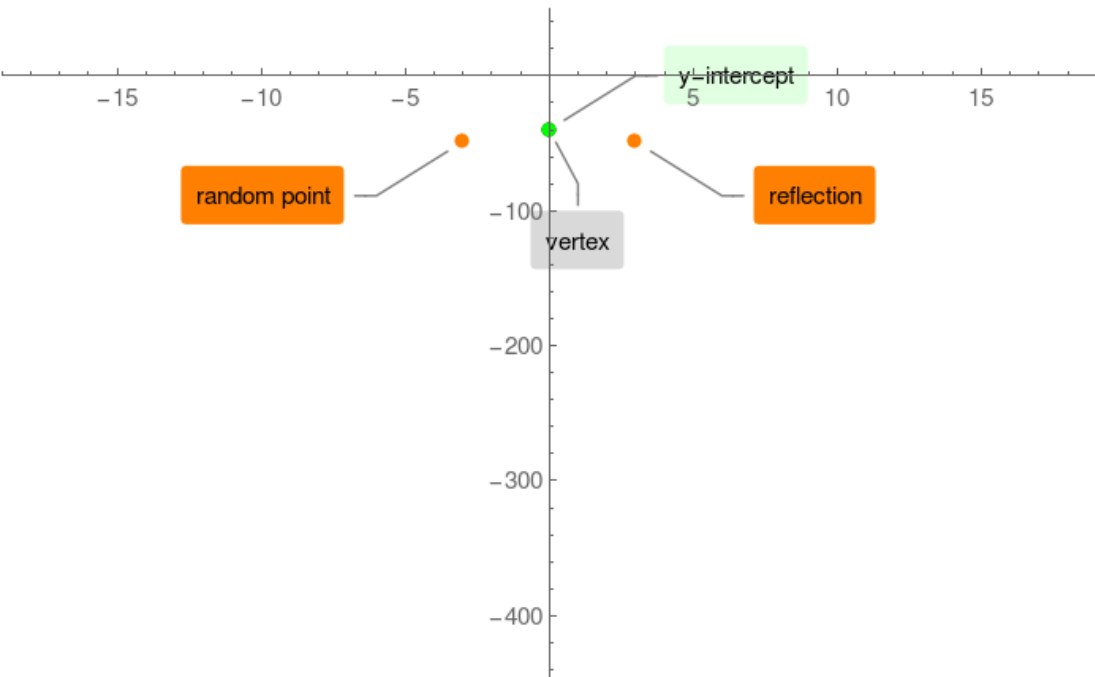

Random point = $(-3, -49)$

Step 4.

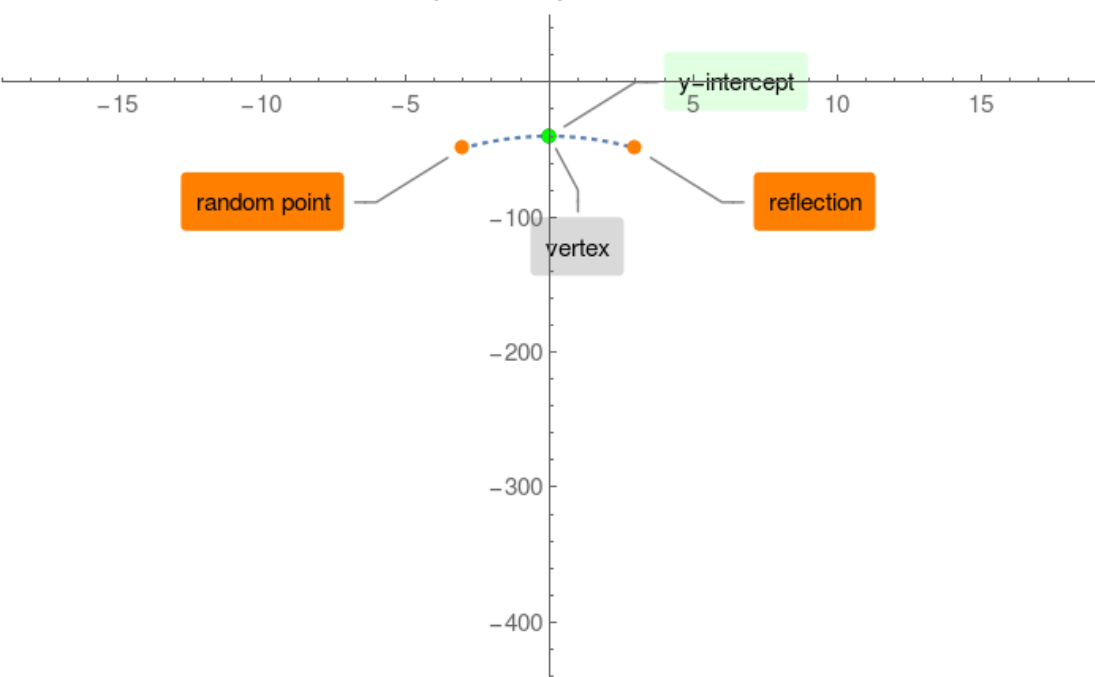

Reflect the point against the vertex's vertical axes:

Reflection = $(3, -49)$

Step 5.

connect the above computed points:

Step 6.

Extend the parabola beyond the range of intercepts
