

Example 3. Vertex equal to vertical intercept

Plot $y(v) = -v^2 - 160$

Step 1.

Compute vertex and plot single point:

vertex = $(0, -160)$

Step 2.

Compute y-intercept and plot single point:

y-intercept = $(0, -160)$

Step 3.

There are no v-intercepts!

Instead compute an arbitrary point on any side of vertex:

Random point = $(-3, -169)$

Step 4.

Reflect the point against the vertex's vertical axes:

Reflection = $(3, -169)$

Step 5.

connect the above computed points:

Step 6.

Extend the parabola beyond the range of intercepts
