

Example 3. Vertex equal to vertical intercept

Plot $g(k) = k^2 + 120$

Step 1.

Compute vertex and plot single point:

vertex = $(0, 120)$

Step 2.

Compute g-intercept and plot single point:

g-intercept = $(0, 120)$

Step 3.

There are no k-intercepts!

Instead compute an arbitrary point on any side of vertex:

Random point = $(-8, 184)$

Step 4.

Reflect the point against the vertex's vertical axes:

Reflection = $(8, 184)$

Step 5.

connect the above computed points:

Step 6.

Extend the parabola beyond the range of intercepts
