## Since I can't divide by zero (division by zero isn't allowed, I need to find all values of j that would cause division by zero. The domain will then be all other j-values.

The domain is all values that j is allowed to be.

When is this denominator equal to zero?

 $j=\pm 4$  then the domain of t is  $\{j \mid j \neq 4 \text{ or } -4\}$ 

 $i^2 - 16 = 0$
