To find the vertical asymptote :

We must set the denominator equal to 0 and solve:  $f^4\!-\!1\!=\!0$ 

 $(f^2-1)(f^2+1)=0$   $(f^2-1)=0$ (f-1)(f+1)=0

(f-1)(f+1)=0f=1 or f=-1 There is vertical asymptote at f=1 and at f=-1

To find the horizontal asymptote :
First we must compare the degrees of the polynomials.

The numerator contains a 3<sup>rd</sup> degree polynomial while the denominator contains a 4<sup>th</sup> degree polynomial.

5

-10

-5

-0.2 -0.4

denominator contains a 4<sup>th</sup> degree polynomial. Since the polynomial in the numerator is a lower degree than the denominator, the horizontal asymptote is located at r=0.

the horizontal asymptote is located at r=0.
To find the oblique asymptote :
Since the degrees of the numerator are less than the degrees of the denominato

Since the degrees of the numerator are less than the degrees of the denominator, this rational does not have an oblique asymptote
