We must set the denominator equal to 0 and solve: k + 1 = 0

To find the vertical asymptote:

To find the horizontal asymptote :

k = -1There is a vertical asymptote at k=-1

First we must compare the degrees of the polynomials.

Both the numerator and denominator are 1st degree polynomials.

Since they are the same degree, we must divide the coefficients of the highest terms. In the numerator, the coefficient of the highest term is 2

In the denominator, the coefficient of the highest term is an understood 1.

The horizontal asymptote is at s=2To find the oblique asymptote : Since the degrees of the numerator and the denominator are the same, this rational does not have an oblique asymptote
