## Average Rate of Change & Secant Line

Average Rate of Change is a single number indicating a rough amount computed for some measurablte entity that changes or varies with time.

Average Rate of Change=  $\frac{f(x_2) - f(x_1)}{x_2 - x_1} = \frac{f(x_1) - f(x_2)}{x_1 - x_2}$ 

A **Secant Line**, also simply called a secant, is a line passing through two points of a curve.

Therefore slope of a secant line is the same as the Average Rate of Change.

Equation for Secant Line, if A indicates Average Rate of Change while  ${f f}({\sf x})$  indicates horizontal axis value for secant line

computes as follows:

 $A = \frac{f(x) - f(x_1)}{x - x_1} \Longrightarrow A(x - x_1) = f(x) - f(x_1) \Longrightarrow A(x - x_1) + f(x_1) = f(x)$ 

 $f(x) = Ax + (f(x_1) - Ax_1)$ 

Example 1.  $e = -\frac{12 \text{ h}}{5} - \frac{16}{5}$  average between -1, 2

-4

10 H

5

-10

-15

e could be temperature of a cup of tea and h time.

e could be gasoline amount and h distance traveled.

 $\Delta e = e(2) - e(-1) = -\frac{12}{5} - \frac{16}{5} - \left(-\frac{12}{5} - \frac{16}{5}\right) = -\frac{36}{5}$ 

**Secant Slope**=Tan  $(\theta) = \frac{e(2) - e(-1)}{2 - (-1)} = -\frac{12}{5}$ 

e could be speed of a car and h time.

Average Rate of Change= $A=-rac{12}{5}$ 

**Secant Line:**  $e = \frac{-\frac{12}{5}}{5} h + (-\frac{16}{5})$
