To find the vertical asymptote : We must set the denominator equal to 0 and solve:  $a_+3_{=0}$ 

a=-3 There is a vertical asymptote at a=-3 To find the horizontal asymptote :

First we must compare the degrees of the polynomials. Both the numerator and denominator are 1<sup>st</sup> degree polynomials.

Since they are the same degree, we must divide the coefficients of the highest terms. In the numerator, the coefficient of the highest term is 5 In the denominator, the coefficient of the highest term is an understood 1. The horizontal asymptote is at h=5

Since the degrees of the numerator and the denominator are the same, this rational does not have an oblique asymptote  $\begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$ 

To find the oblique asymptote :
