of the vertex by finding  $w(-\frac{9}{4}) = 1(-\frac{9}{4})^2 + 9(-\frac{9}{4}) + 16 = \frac{81}{4} - \frac{81}{4} + 16 = -\frac{17}{4}$  Minimum =  $-\frac{17}{4}$ 

## Salution Quadratic function: is a function that can be written in the form:

w(v)=av2+bv+c where a, b, and c are real numbers and a+0

we have  $w(v) = v^2 + 9v + 16$ , note:  $v^2 + 9v + 16$  is in vw-plane

Since a>0 , we know that the w-coordinate of the vertex is a minimum. However, to find the w-coordinate of our vertex we first need to find the y-coordinate of the vertex by using  $y = -\frac{b}{b} = -\frac{0}{b} = -\frac{0}{b}$ . Now that we have the y-coordinate, we can find the w-coordinate of our vertex we first need to find the y-coordinate of the vertex by using  $y = -\frac{b}{b} = -\frac{0}{b} = -\frac{0}{b}$ . Now that we have the y-coordinate, we can find the w-coordinate of the vertex by using  $y = -\frac{b}{b} = -\frac{0}{b} = -\frac{0}{b}$ .

Here, we know that a=1, b=9, c=16
