```
Example 2. No horizontal intercepts found
Plot j(u) = -u^2 + 4u - 84
Step 1.
Compute vertex and plot single point:
vertex=(2,-80)
                            -100
                            -200
                            -300
                            -400
                            -500
Step 2.
Compute j-intercept and plot single point:
j-intercept = (0, -84)
     -15
                                                10
                                                        15
                 j-intercept
                                   vertex
                            -200
                            -300
                            -400
                            -500
     -15
             -10
                                                10
                                                        15
                                              reflection
                 j-intercept
                                   vertex
                            -200
                            -300
```

-300 -400

-500 Step 5.

Extend the parabola beyond the range of intercepts -15 -10 10 15

reflection j-intercept =100 vertex -200 -300

-400

-500
